“In these times when everyone is concerned with the environment and their savings accounts, we felt it was time to place affordable, green solutions into the market.”

Philip E. Riley Jr., USP CEO

New service offering provides affordable green solutions for your Citizens...

With a portfolio of over 400,000 products in the U.S. and several existing utility partnerships, USP is one of the largest warranty providers in North America and is part of Macquarie Capital Group.

These days, more and more Americans are worried about the environment and the economy. Most homeowners would like to “do their share” and adopt green solutions for their homes but the price tag on the technology is out of reach for most folks.

Utility Service Partners, Inc. (USP), a leading provider of both water heater and appliance rentals, as well as home warranties, is pleased to announce it is introducing a new program which will allow homeowners to rent tankless water heating systems.

USP offers an extensive selection of affordable consumer warranties for outside and in-home utility lines. These value-added products provide citizens with 24 hour repair and replacement service for broken or damaged utility lines.

The Lifetime Water Heater Plan utilizes energy efficient equipment and provides a service guarantee for worry-free hot water. This program provides homeowners with a low cost option to utilize energy efficient appliances while reducing energy usage and monthly bills.

... And benefits to your City.

In difficult times, citizens look to the city for service. USP provides solutions to common problems faced by homeowners.

Citizens expect city officials to help with home-related problems. Telling their citizens they are unable to help can be frustrating. The USP program offers cities the opportunity to enhance their image by providing additional services that benefits its residents.

USP programs are not the total solution, but they are a piece of the Green Solution for cities. Ensuring timely repair of broken water lines conserves water resources. Performing quality repairs to broken sewer lines minimizes waste water pollution. High efficiency gas and electric water heaters release less carbon dioxide into the environment. USP programs enable cities to achieve green initiatives for little or no cost.
